

# SEAPLAN

*YUCO micro-AUV comes with an intuitive mission planning software called SEAPLAN, developed by SEABER.*

Using **SEAPLAN** user-friendly graphical interface and preset navigation patterns, AUV mission planning has never been easier, even for non-specialists. In a single view, the user can see and edit the elements of the mission, including 3D path, speed control, payload activation, deployment and recovery strategies.

Using the AUV Dashboard, the user can easily monitor the **YUCO** and display faults, resolutions tips and sensor status. In a few clicks, calibrate your AUV and update **SEAPLAN**, **YUCO** and **SEACOMM**.

Both AUV and sensor logs can be easily exported in .CSV or .XTF format, using Wi-Fi connection with the **YUCO**. Logs and sensor data are timestamped and synchronized with the navigation data so they can be immediately analyzed in the debrief view or with your own tools.
